Chapter 1

PX915 Group Project - Group A

This is a simulation code for a half-cell single particle model (half-SPM model) written in Fortran90 and interfaced with Python. The code calculates the change in concentration in a single, spherical particle for a set simulation time from which a voltage profile can also be obtained. The relevant input parameters can be set in the Jupyter notebook 'Input_NetCDF.ipynb' file, which saves the parameters as a NetCDF file. This will be read by the programme, which runs the simulation and returns a visualisation of the concentration and (if chosen) of the voltage profile.

1.1 Getting started

A Jupyter notebook tutorial is provided to guide the user through the the main features of the simulation package. This is most easily accessed by cloning the GitHub repository to the machine that will be used to run the simulation.

```
git clone https://github.com/HubertJN/PX915_Group_Project.git
```

The tutorial notebook can be accessed by moving to the directory containing the cloned repository and opening a new jupyter notebook environment.

```
cd [directory the repository has been cloned to]
jupyter notebook
```

There is the option to either start a new simulation or to continue a simulation from a checkpoint file. In the first case, all the input parameters have to be set and a new input file in NetCDF format will be created. If the simulation is continued from the checkpoint file, all input parameters are kept the same as for the first run except for the simulation length and the number of simulation steps after which a new checkpoint file is created.

1.2 Setting the input parameters

The default parameters are for a positive NCM (Nickel-Cobalt-Manganese) electrode and were taken from [Chen2020](#).

The notebook provides slider bars and an input cell that allow the user to change the input parameters within suggested ranges. There is also the option so set the parameters in a unrestricted input cell – however the user is advised to use this sensibly, since it otherwise might lead to unphysical behaviour or failure of the code.

Important consideration are:

- time step: if the time steps are set too high, the simulation might take too long to complete
- SOC and applied current: at 0% or 100% state of charge (SOC), the applied current should be set positive (charging) or negative (discharging/use), respectively
- If an anode material is being simulated, it will still be the positive electrode with respect to lithium in this half-cell SMP model and the parameters need to be set accordingly

1.3 Running the simulation

Once the input parameters are set and the 'SPM_input.nc' file has been created, the simulation can be run using the provided Makefile. To compile the code the command is:

```
make
```

To run the simulation, the command is:

```
make exe
```

To visualise the output, the command is:

```
make visual
```

1.4 Documentation

For more information see our [documentation](#). If the documentation needs to be re-generated, input the following into the command prompt.

```
make docs
```

1.5 Uncertainty quantification

There are a variety of options to visualise the uncertainties involved with the simulation. The following commands represent the available uncertainty quantification options.

Perform sensitivity analysis and then display the results.

```
make sensitive
```

Display the results from the sensitivity analysis.

```
make vis_sens
```

Perform uncertainty propagation using random latin hypercube sampling and display the results.

```
make uncertain
```

Display the results from random latin hypercube sampling.

```
make uncer_vis
```

Perform sensitivity analysis and perform random latin hypercube sampling. Then calculate uncertainty from the standard deviations and random latin hypercube sampling. Then display results.

```
make sens_uncer
```

Visualise results of calculated uncertainties from the standard deviations and random latin hypercube sampling.

```
make vis_sens_uncer
```

Calculates the uncertainty from the standard deviations and then, assuming random latin hypercube sampling has been performed, displays both.

```
make sens_uncer_sep
```

1.6 How to run the data fitting

Download the /venv/ directory, which contains all the necessary python libraries which the data fitting notebook, 'DataFit_int.ipynb', requires. The /venv/ directory is a virtual environment, and launching Jupyter notebook inside this virtual environment will allow Jupyter to use the required libraries without the user needing to install them. To activate the virtual environment, go to the directory where /venv/ is stored. This directory should also contain the solver used for data fitting, 'datafitPde.f90', and the notebook that runs the datafitting, 'DataFit_int.ipynb'. Once the /venv/ directory and the aforementioned programs are stored in the same location, the virtual environment needs to be launched. To launch the virtual environment, move to the location where it is stored in a terminal and type the following command:

```
source /venv/bin/activate
```

You can tell if the virtual environment is activated if you can see '(venv)' written before your current working directory in the terminal. Jupyter notebook can now be launched in this virtual environment by typing the following in the same terminal:

```
jupyter notebook
```

Once Jupyter is launched, find the notebook 'DataFit_int.ipynb' in the Jupyter file browser and open it. You can then run the cells accordingly to perform the optimisation on the diffusion coefficient.

Chapter 2

Finite Difference Formulation

This section outline the formulae used within the code in order to carry out the simulation. Whenever a variable or code snippet refers to the formulation section, this is the part of the code being referred to.

2.1 Matrix A

This is the left hand side coefficient matrix of the system of equations used within the simulation, of size $n \times n$ with elements given by

$$A_{i,j} = \begin{cases} -\frac{\Delta t D}{2\Delta r^2} + \frac{\Delta t D}{2r_i \Delta r} & j = i - 1 \text{ for } 2 \leq i \leq n - 1 \\ 1 + \frac{\Delta t D}{\Delta r^2} & j = i \\ -\frac{\Delta t D}{2r_i \Delta r} - \frac{\Delta t D}{2\Delta r^2} & j = i + 1 \text{ for } 2 \leq i \leq n - 1 \\ -\frac{\Delta t D}{\Delta r^2} & (i, j) = (1, 2), (n, n - 1) \end{cases}$$

2.2 Matrix B

This is the right hand side coefficient matrix of the system of equations used within the simulation, of size $n \times n$ with elements given by

$$B_{i,j} = \begin{cases} \frac{\Delta t D}{2\Delta r^2} - \frac{\Delta t D}{2r_i \Delta r} & j = i - 1 \text{ for } 2 \leq i \leq n - 1 \\ 1 - \frac{\Delta t D}{\Delta r^2} & j = i \\ \frac{\Delta t D}{2r_i \Delta r} + \frac{\Delta t D}{2\Delta r^2} & j = i + 1 \text{ for } 2 \leq i \leq n - 1 \\ \frac{\Delta t D}{\Delta r^2} & (i, j) = (1, 2), (n, n - 1) \end{cases}$$

6.2 input_output_netcdf Module Reference

Functions/Subroutines

- subroutine [error_check](#) (ierr)
Error checking subroutine for NetCDF.
- subroutine [assign_int](#) (file_id, act, vect, sing, var_name, var_id_in, var_id_out)
I/O subroutine that reads integers from a NetCDF file or writes integers to a NetCDF file.
- subroutine [assign_real](#) (file_id, act, vect, sing, var_name, var_id_in, var_id_out)
I/O subroutine that reads reals from a NetCDF file or writes reals to a NetCDF file.
- subroutine [assign_exp_int](#) (var, file_id, it, var_name, var_id_in)
I/O subroutine that writes integer arrays to a variable with an infinite dimension.
- subroutine [assign_exp_real](#) (var, file_id, it, var_name, var_id_in)
I/O subroutine that writes real arrays to a variable with an infinite dimension.
- subroutine [create_sing_var](#) (var_name, var_typ, var_len, file_id, units, act, var_id_out)
I/O subroutine that creates a named variable with specific length and data type within a NetCDF file.
- subroutine [create_exp_var](#) (var_name, var_typ, var_len, file_id, units, act, var_id_out)
I/O subroutine that creates an expanding variable with specific dimensions and data type within a NetCDF file.
- subroutine [save_int](#) (var_name, file_id, vect, sing, units, act, var_len)
I/O subroutine that writes an integer vector or single number to existing variable within a NetCDF file.
- subroutine [save_real](#) (var_name, file_id, vect, sing, units, act, var_len)
I/O subroutine that writes a real vector or single number to existing variable within a NetCDF file.
- subroutine [fin_in_out](#) ()
Subroutine that closes NetCDF output and checkpoint files that are open.
- subroutine [import_input](#) (file_name)
I/O subroutine that opens a NetCDF file, reads values, writes them to global variables and closes the file.
- subroutine [initiate_file](#) (file_name)
I/O subroutine that creates a NetCDF file, initiates input variables and saves variables that are available.
- subroutine [initiate_checkp](#) (file_name)
I/O subroutine that creates a NetCDF file, initiates checkpoint specific variables and saves available variables.
- subroutine [load_checkp](#) (check_file_name, out_file_name, conc, [volt_do](#))
I/O subroutine that reads from a checkpoint file and saves the concentration vector.
- subroutine [update_checkp](#) (conc, step_num)
This subroutine overwrites the concentration vector (conc) and number of time steps (step_num) in the checkpoint NetCDF file.

Variables

- integer, parameter [dp](#) =kind(1.0D0)
- real(kind=real64), parameter [farad](#) = 96485.3321233100184_DP
farad is the Faraday constant, F
- real(kind=real64), parameter [gas_con](#) = 8.31446261815324_DP
gas_con is the ideal gas constant, R_g
- real(kind=real64) [temp](#)
temp is the temperature of the simulation, T
- real(kind=real64) [rad](#)
rad is the radius of the particle, R
- real(kind=real64) [thick](#)
- real(kind=real64) [rr_coef](#)
rr_coef is the reaction rate coefficient, K

- real(kind=real64) [dif_coef](#)
dif_coef is the diffusion coefficient, D
- real(kind=real64) [iapp](#)
iapp is the applied current density as a function of time, i_{app}
- real(kind=real64) [init_c](#)
init_c is the initial concentration, c_0
- real(kind=real64) [max_c](#)
max_c is the maximum concentration of the simulation, c_{max}
- real(kind=real64) [dt](#)
dt is the time step
- real(kind=real64) [vol_per](#)
vol_per is the active material volume fraction, ϵ_{actk}
- real(kind=real64) [final_time](#)
final_time is the time of the final time step
- integer(kind=int32) [sim_steps](#)
sim_steps is the number of simulation steps
- integer(kind=int32) [out_steps](#)
out_steps is the number of steps before writing to output file
- integer(kind=int32) [space_steps](#)
space_steps is the resolution of the radius
- integer(kind=int32) [tot_steps](#)
tot_steps is the total number of simulation steps

- integer(kind=int32) [output_id](#)
output_id is the id of the output file
- integer(kind=int32) [check_id](#)
check_id is the id of the checkpoint file

- integer(kind=int32) [volt_out_id](#)
volt_out_id is the variable id of the voltage in the output file
- integer(kind=int32) [conc_out_id](#)
conc_out_id is the variable id of the concentration in the output file
- integer(kind=int32) [conc_check_id](#)
- integer(kind=int32) [time_check_id](#)
time_check_id is the id of the final time of the simulation in the checkpoint file
- integer(kind=int32) [ts_check_id](#)
ts_check_id is the id of the final time step of the simulation in the checkpoint file
- logical [volt_do](#)
volt_do is the logical value which determines whether to calculate voltage to the outputfile
- logical [checkpoint](#)
checkpoint is the logical value which determines whether to restart simulation from the checkpoint

- integer(kind=int32) [volt_do_int](#)
volt_do_int is the binary representation of the volt_do variable
- integer(kind=int32) [checkpoint_int](#)
checkpoint_int is the binary representation of the checkpoint_int

6.2.1 Function/Subroutine Documentation

6.2.1.1 assign_exp_int()

```
subroutine input_output_netcdf::assign_exp_int (
    integer(kind=int32), dimension(:, :), intent(in) var,
    integer(kind=int32), intent(in) file_id,
    integer(kind=int32), intent(in) it,
    character(len=*), intent(in), optional var_name,
    integer(kind=int32), intent(in), optional var_id_in )
```

I/O subroutine that writes integer arrays to a variable with an infinite dimension.

This subroutine writes a 2D integer array 'var', to the variable named 'var_name' with variable id 'var_id_in' in the NetCDF file with id 'file_id' at position 'it'.

This should be used to write integer arrays 'var', to a variable 'var_name', with an infinite dimension

Parameters

in	<i>var</i>	2D integer array
in	<i>var_name</i>	name of variable to write
in	<i>var_id_in</i>	id of variable to write
in	<i>file_id</i>	id of NetCDF file to write to
in	<i>it</i>	position within NetCDF file to write to

Definition at line 318 of file input_output_netcdf.f90.

6.2.1.2 assign_exp_real()

```
subroutine input_output_netcdf::assign_exp_real (
    real(kind=real64), dimension(:, :), intent(in) var,
    integer(kind=int32), intent(in) file_id,
    integer(kind=int32), intent(in) it,
    character(len=*), intent(in), optional var_name,
    integer(kind=int32), intent(in), optional var_id_in )
```

I/O subroutine that writes real arrays to a variable with an infinite dimension.

This subroutine writes a 2D real array 'var', to the variable named 'var_name' with variable id 'var_id_in' in the NetCDF file with id 'file_id' at position 'it'.

This should be used to write real arrays 'var', to a variable 'var_name', with an infinite dimension

Parameters

in	<i>var</i>	2D real array
in	<i>var_name</i>	name of variable to write
in	<i>var_id_in</i>	id of variable to write
in	<i>file_id</i>	id of NetCDF file to write to
in	<i>it</i>	position within NetCDF file to write to

Definition at line 357 of file input_output_netcdf.f90.

6.2.1.3 assign_int()

```
subroutine input_output_netcdf::assign_int (
    integer(kind=int32), intent(in) file_id,
    character(len=*), intent(in) act,
    integer(kind=int32), dimension(:), intent(inout), optional vect,
    integer(kind=int32), intent(inout), optional sing,
    character(len=*), intent(in), optional var_name,
    integer(kind=int32), intent(in), optional var_id_in,
    integer(kind=int32), intent(out), optional var_id_out )
```

I/O subroutine that reads integers from a NetCDF file or writes integers to a NetCDF file.

This subroutine reads or writes a single integer or a vector of integers, from or to a variable with a given name or variable id in a NetCDF file with a given NetCDF id.

What the subroutine does is dictated by the input arguments. One of the arguments sing and vect must be inputted into the subroutine as well as one of the arguments var_name and var_id_in.

Optionally you can save the variable id by inputting a variable to store it, var_id_out.

Parameters

in	<i>act</i>	subroutine action: 'r' for read and 'w' for write
in, out	<i>sing</i>	single integer to read/write, optional argument
in, out	<i>vect</i>	vector of integers to read/write, optional argument
in	<i>var_name</i>	name of variable to read from or write to, optional argument
in	<i>var_id_in</i>	id of variable to read from or write to, optional argument
in	<i>file_id</i>	NetCDF file id
out	<i>var_id_out</i>	id of variable to store var_id_in, optional argument

Definition at line 168 of file input_output_netcdf.f90.

6.2.1.4 assign_real()

```
subroutine input_output_netcdf::assign_real (
    integer(kind=int32), intent(in) file_id,
    character(len=*), intent(in) act,
    real(kind=real64), dimension(:), intent(inout), optional vect,
    real(kind=real64), intent(inout), optional sing,
    character(len=*), intent(in), optional var_name,
    integer(kind=int32), intent(in), optional var_id_in,
    integer(kind=int32), intent(out), optional var_id_out )
```

I/O subroutine that reads reals from a NetCDF file or writes reals to a NetCDF file.

This subroutine reads or writes a single real or a vector of reals, from or to a variable with a given name or variable id in a NetCDF file with a given NetCDF id.

What the subroutine does is dictated by the input arguments. One of the arguments *sing* and *vect* must be inputted into the subroutine as well as one of the arguments *var_name* and *var_id_in*.

Optionally you can save the variable id by inputting a variable to store it, *var_id_out*.

Parameters

in	<i>act</i>	subroutine action: 'r' for read and 'w' for write
in, out	<i>sing</i>	single real to read/write, optional argument
in, out	<i>vect</i>	vector of reals to read/write, optional argument
in	<i>var_name</i>	name of variable to read from or write to, optional argument
in	<i>var_id_in</i>	id of variable to read from or write to, optional argument
in	<i>file_id</i>	NetCDF file id
out	<i>var_id_out</i>	id of variable to store <i>var_id_in</i> , optional argument

Definition at line 247 of file `input_output_netcdf.f90`.

6.2.1.5 create_exp_var()

```
subroutine input_output_netcdf::create_exp_var (
    character(len=*), intent(in) var_name,
    integer(kind=int32), intent(in) var_typ,
    integer(kind=int32), intent(in) var_len,
    integer(kind=int32), intent(in) file_id,
    character(len=*), intent(in), optional units,
    character(len=*), intent(in), optional act,
    integer(kind=int32), intent(out), optional var_id_out )
```

I/O subroutine that creates an expanding variable with specific dimensions and data type within a NetCDF file.

This subroutine creates an expanding variable called '*var_name*' with dimensions '*var_len* x undefined' and data type '*var_typ*' (in this case *f90_int* or *f90_double*) in a NetCDF file with id '*file_id*'

You can optionally prescribe units to the variable '*units*', and if you want to save the variable id you can input a variable to store it '*var_id_out*'

If the file is NOT in definition mode, so already exists, you can use (*act*='add') to add the variable to an existing netcdf file with id '*file_id*'

Parameters

in	<i>var_name</i>	name of variable to be created in NetCDF file
in	<i>var_len</i>	length of variable to be created in NetCDF file
in	<i>var_type</i>	data type of variable to be created, <i>f90_int</i> or <i>f90_double</i>
in	<i>file_id</i>	id of NetCDF file where variable is being created
in	<i>units</i>	units of variable, optional argument
out	<i>var_id_out</i>	variable to store NetCDF variable id, optional argument
in	<i>act</i>	set to 'add' to add variable to existing NetCDF file, optional argument

Definition at line 457 of file input_output_netcdf.f90.

6.2.1.6 create_sing_var()

```
subroutine input_output_netcdf::create_sing_var (
    character(len=*), intent(in) var_name,
    integer(kind=int32), intent(in) var_typ,
    integer(kind=int32), intent(in) var_len,
    integer(kind=int32), intent(in) file_id,
    character(len=*), intent(in), optional units,
    character(len=*), intent(in), optional act,
    integer(kind=int32), intent(out), optional var_id_out )
```

I/O subroutine that creates a named variable with specific length and data type within a NetCDF file.

This subroutine creates a variable called 'var_name' with length 'var_len' and data type 'var_typ' (in this case f90_int or f90_double) in a NetCDF file with id 'file_id'

You can optionally prescribe units to the variable 'units', and if you want to save the variable id you can input a variable to store it 'var_id_out'

If the file is NOT in definition mode, so already exists, you can use (act='add') to add the variable to an existing netcdf file with id 'file_id'

Parameters

in	<i>var_name</i>	name of variable to be created in NetCDF file
in	<i>var_len</i>	length of variable to be created in NetCDF file
in	<i>var_type</i>	data type of variable to be created, f90_int or f90_double
in	<i>file_id</i>	id of NetCDF file where variable is being created
in	<i>units</i>	units of variable, optional argument
out	<i>var_id_out</i>	variable to store NetCDF variable id, optional argument
in	<i>act</i>	set to 'add' to add variable to existing NetCDF file, optional argument

Definition at line 402 of file input_output_netcdf.f90.

6.2.1.7 error_check()

```
subroutine input_output_netcdf::error_check (
    integer, intent(in) ierr )
```

Error checking subroutine for NetCDF.

This subroutine takes in an integer error code from NetCDF (ierr), prints out the associated error, and stops the code. If there is no error, subroutine continues

Parameters

<i>in</i>	<i>ierr</i>	NetCDF error code
-----------	-------------	-------------------

Definition at line 138 of file input_output_netcdf.f90.

6.2.1.8 fin_in_out()

```
subroutine input_output_netcdf::fin_in_out
```

Subroutine that closes NetCDF output and checkpoint files that are open.

Definition at line 575 of file input_output_netcdf.f90.

6.2.1.9 import_input()

```
subroutine input_output_netcdf::import_input (
    character(len=*), intent(in), optional file_name )
```

I/O subroutine that opens a NetCDF file, reads values, writes them to global variables and closes the file.

As a test case, if no file_name is given a series of test values are prescribed instead

Parameters

<i>in</i>	<i>file_name</i>	name of NetCDF file to open
-----------	------------------	-----------------------------

Definition at line 593 of file input_output_netcdf.f90.

6.2.1.10 initiate_checkpoint()

```
subroutine input_output_netcdf::initiate_checkpoint (
    character(len=*), intent(in) file_name )
```

I/O subroutine that creates a NetCDF file, initiates checkpoint specific variables and saves available variables.

Parameters

<i>in</i>	<i>file_name</i>	name of NetCDF file to create
-----------	------------------	-------------------------------

Definition at line 714 of file input_output_netcdf.f90.

6.2.1.11 initiate_file()

```
subroutine input_output_netcdf::initiate_file (
    character(len=*), intent(in) file_name )
```

I/O subroutine that creates a NetCDF file, initiates input variables and saves variables that are available.

Parameters

in	<i>file_name</i>	name of NetCDF file to create
----	------------------	-------------------------------

Definition at line 659 of file input_output_netcdf.f90.

6.2.1.12 load_checkp()

```
subroutine input_output_netcdf::load_checkp (
    character(len=*), intent(in) check_file_name,
    character(len=*), intent(in) out_file_name,
    real(kind=real64), dimension(:), intent(inout) conc,
    logical, intent(in) volt_do )
```

I/O subroutine that reads from a checkpoint file and saves the concentration vector.

This subroutine reads from a checkpoint file named 'file_name' and saves the concentration vector to 'conc'. It extracts other variables to keep track of the total simulation steps and total simulation time. It also opens an old netcdf output file and gets variable ids for the variables it will write new data to.

Parameters

in	<i>check_file_name</i>	name of NetCDF checkpoint file to read
in	<i>out_file_name</i>	name of NetCDF file to write to
in, out	<i>conc</i>	concentration vector
in	<i>volt_do</i>	logic value to determine whether to write voltage

Definition at line 747 of file input_output_netcdf.f90.

6.2.1.13 save_int()

```
subroutine input_output_netcdf::save_int (
    character(len=*), intent(in) var_name,
    integer(kind=int32), intent(in) file_id,
    integer(kind=int32), dimension(:), intent(inout), optional vect,
    integer(kind=int32), intent(inout), optional sing,
    character(len=*), intent(in), optional units,
    character(len=*), intent(in), optional act,
    integer(kind=int32), intent(in), optional var_len )
```

I/O subroutine that writes an integer vector or single number to existing variable within a NetCDF file.

This subroutine writes an integer vector 'vect' or single number 'sing' to an existing variable named 'var_name' in a NetCDF file with id 'file_id' if (act='new'), this assumes the variable does not already exist and will create an integer variable called 'var_name' with length 'var_len' and units 'units' and write the integer variable ('vect' or 'sing') to this variable.

Parameters

in	<i>var_name</i>	name of variable to write to in NetCDF file
in	<i>file_id</i>	id of NetCDF file where variable is being written
in, out	<i>vect</i>	integer vector to be written, optional argument
in, out	<i>sing</i>	single integer to be written, optional argument
in	<i>units</i>	units of variable, optional argument
in	<i>act</i>	set to 'new' to create variable in NetCDF file, optional argument
in	<i>var_len</i>	length of variable to be created in NetCDF file

Definition at line 512 of file input_output_netcdf.f90.

6.2.1.14 save_real()

```
subroutine input_output_netcdf::save_real (
    character(len=*), intent(in) var_name,
    integer(kind=int32), intent(in) file_id,
    real(kind=real64), dimension(:), intent(inout), optional vect,
    real(kind=real64), intent(inout), optional sing,
    character(len=*), intent(in), optional units,
    character(len=*), intent(in), optional act,
    integer(kind=int32), intent(in), optional var_len )
```

I/O subroutine that writes a real vector or single number to existing variable within a NetCDF file.

This subroutine writes a real vector 'vect' or single number 'sing' to an existing variable named 'var_name' in a NetCDF file with id 'file_id' if (act='new'), this assumes the variable does not already exist and will create an integer variable called 'var_name' with length 'var_len' and units 'units' and write the real variable ('vect' or 'sing') to this variable.

Parameters

in	<i>var_name</i>	name of variable to write to in NetCDF file
in	<i>file_id</i>	id of NetCDF file where variable is being written
in, out	<i>vect</i>	integer vector to be written, optional argument
in, out	<i>sing</i>	single integer to be written, optional argument
in	<i>units</i>	units of variable, optional argument
in	<i>act</i>	set to 'new' to create variable in NetCDF file, optional argument
in	<i>var_len</i>	length of variable to be created in NetCDF file

Definition at line 551 of file input_output_netcdf.f90.

6.2.1.15 update_checkp()

```
subroutine input_output_netcdf::update_checkp (
    real(kind=real64), dimension(:), intent(inout) conc,
    integer(kind=int32), intent(inout) step_num )
```

This subroutine overwrites the concentration vector (*conc*) and number of time steps (*step_num*) in the checkpoint NetCDF file.

I/O subroutine that overwrites the concentration vector and number of time steps in the checkpoint NetCDF file

Parameters

<i>in, out</i>	<i>conc</i>	concentration vector
<i>in, out</i>	<i>step_num</i>	number of time steps

Definition at line 782 of file input_output_netcdf.f90.

6.2.2 Variable Documentation**6.2.2.1 check_id**

```
int32 check_id
```

check_id is the id of the checkpoint file

Definition at line 125 of file input_output_netcdf.f90.

6.2.2.2 checkpoint

```
logical checkpoint
```

checkpoint is the logical value which determines whether to restart simulation from the checkpoint

Definition at line 127 of file input_output_netcdf.f90.

6.2.2.3 checkpoint_int

```
int32 checkpoint_int
```

checkpoint_int is the binary representation of the *checkpoint_int*

Definition at line 128 of file input_output_netcdf.f90.

6.2.2.4 conc_check_id

```
integer(kind=int32) conc_check_id
```

Definition at line 126 of file input_output_netcdf.f90.

6.2.2.5 conc_out_id

```
int32 conc_out_id
```

conc_out_id is the variable id of the concentration in the output file

Definition at line 126 of file input_output_netcdf.f90.

6.2.2.6 dif_coef

```
real64 dif_coef
```

dif_coef is the diffusion coefficient, D

It has units of $m^2 s^{-1}$

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.7 dp

```
integer, parameter dp =kind(1.0D0)
```

Definition at line 119 of file input_output_netcdf.f90.

6.2.2.8 dt

```
real64 dt
```

dt is the time step

It has units of s

Definition at line 123 of file input_output_netcdf.f90.

6.2.2.9 farad

```
real64 farad = 96485.3321233100184_DP
```

farad is the Faraday constant, F

It has units of $Cmol^{-1}$

Definition at line 120 of file input_output_netcdf.f90.

6.2.2.10 final_time

```
real64 final_time
```

final_time is the time of the final time step

It has units of s

Definition at line 123 of file input_output_netcdf.f90.

6.2.2.11 gas_con

```
real64 gas_con = 8.31446261815324_DP
```

gas_con is the ideal gas constant, R_g

It has units of $JK^{-1}mol^{-1}$

Definition at line 121 of file input_output_netcdf.f90.

6.2.2.12 iapp

```
real64 iapp
```

iapp is the applied current density as a function of time, i_{app}

It has units of Am^{-2}

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.13 init_c

```
real64 init_c
```

init_c is the initial concentration, c_0

It has units of molm^{-3}

Definition at line 123 of file input_output_netcdf.f90.

6.2.2.14 max_c

```
real64 max_c
```

max_c is the maximum concentration of the simulation, c_{max}

It has units of molm^{-3}

Definition at line 123 of file input_output_netcdf.f90.

6.2.2.15 out_steps

```
int32 out_steps
```

out_steps is the number of steps before writing to output file

Definition at line 124 of file input_output_netcdf.f90.

6.2.2.16 output_id

```
int32 output_id
```

output_id is the id of the output file

Definition at line 125 of file input_output_netcdf.f90.

6.2.2.17 rad

```
real64 rad
```

rad is the radius of the particle, R

It has units of m

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.18 rr_coef

```
real64 rr_coef
```

rr_coef is the reaction rate coefficient, K

It has units of $Am^2 (m^3 mol^{-1})^{1.5}$

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.19 sim_steps

```
int32 sim_steps
```

sim_steps is the number of simulation steps

Definition at line 124 of file input_output_netcdf.f90.

6.2.2.20 space_steps

```
int32 space_steps
```

space_steps is the resolution of the radius

Definition at line 124 of file input_output_netcdf.f90.

6.2.2.21 temp

```
real64 temp
```

temp is the temperature of the simulation, T

It has units of K

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.22 thick

```
real(kind=real64) thick
```

Definition at line 122 of file input_output_netcdf.f90.

6.2.2.23 time_check_id

```
int32 time_check_id
```

time_check_id is the id of the final time of the simulation in the checkpoint file

Definition at line 126 of file input_output_netcdf.f90.

6.2.2.24 tot_steps

```
int32 tot_steps
```

tot_steps is the total number of simulation steps

Definition at line 124 of file input_output_netcdf.f90.

6.2.2.25 ts_check_id

```
int32 ts_check_id
```

ts_check_id is the id of the final time step of the simulation in the checkpoint file

Definition at line 126 of file input_output_netcdf.f90.

6.2.2.26 vol_per

```
real64 vol_per
```

vol_per is the active material volume fraction, ϵ_{actk}

Definition at line 123 of file input_output_netcdf.f90.

6.2.2.27 volt_do

```
logical volt_do
```

volt_do is the logical value which determines whether to calculate voltage to the outputfile

Definition at line 127 of file input_output_netcdf.f90.

6.2.2.28 volt_do_int

```
int32 volt_do_int
```

volt_do_int is the binary representation of the volt_do variable

Definition at line 128 of file input_output_netcdf.f90.

6.2.2.29 volt_out_id

```
int32 volt_out_id
```

volt_out_id is the variable id of the voltage in the output file

Definition at line 126 of file input_output_netcdf.f90.

6.3 pde_solver Module Reference**Functions/Subroutines**

- subroutine [setup_crank_nicholson](#) (A, B)
Subroutine to setup the matrices of the system of equations.
- real(real64) function, dimension(:), allocatable [crank_nicholson](#) (A, B, c_cur)
Crank-Nicholson function.
- real(real64) function [u_scalar](#) (x)
Function to calculate the positive electrode OCV curve, $U(c)$.
- real(real64) function, dimension(:), allocatable [u_arr](#) (x)
Array version to the U_scalar function.
- real(real64) function [volt_scalar](#) (cin)
Scalar voltage calculator.
- real(real64) function, dimension(:), allocatable [volt_array](#) (arrin)
Array voltage calculator.

Variables

- real(kind=real64) [rhs_const](#)
Rescaled source at the flux boundary given by: $\left(dt + \frac{dt}{dr}\right) \frac{200Ri_{app}}{3\epsilon_{actk}FL}$.
- real(kind=real64) [volt_con_ial](#)
This is a combination of parameters given by: $\frac{100i_{app}R}{3\epsilon_{actk}L}$.
- real(kind=real64) [volt_con_rtf](#)
This is a combination of parameters given by: $\frac{2R_gT}{F}$.
- real(kind=real64) [mod_dif](#)
The rescaled diffusion coefficient given by: $\frac{D}{R^2}$

6.3.1 Function/Subroutine Documentation

6.3.1.1 crank_nicholson()

```
real(real64) function, dimension(:), allocatable pde_solver::crank_nicholson (
    real(real64), dimension(:,:), intent(in), allocatable A,
    real(real64), dimension(:,:), intent(in), allocatable B,
    real(real64), dimension(:), intent(in) c_cur )
```

Crank-Nicholson function.

Solves the diffusion equation with a constant diffusion coefficient and a constant i_{app} using the Crank-Nicholson algorithm. The function uses the LAPACK library, calling the dgesv function for solving systems of linear equations to evolve the given state by one timestep.

Parameters

in	A	The left hand side coefficient matrix of the system of equations (please refer to formulation section for specific details on the matrix elements)
in	B	The right hand side coefficient matrix of the system of equations (please refer to formulation section for specific details on the matrix elements)
in	c_{cur}	The current time concentration array inputed into the Crank-Nicholson solver.

Definition at line 115 of file pde.f90.

6.3.1.2 setup_crank_nicholson()

```
subroutine pde_solver::setup_crank_nicholson (
    real(real64), dimension(space_steps,space_steps), intent(inout) A,
    real(real64), dimension(space_steps,space_steps), intent(inout) B )
```

Subroutine to setup the matrices of the system of equations.

This subroutine takes in the corresponding matrices and assigns their elements as the appropriate coefficients in the discretised diffusion equation using the Crank-Nicholson scheme.

Parameters

in	A	The left hand side coefficient matrix of the system of equations (please refer to formulation section for specific details on the matrix elements)
in	B	The right hand side coefficient matrix of the system of equations (please refer to formulation section for specific details on the matrix elements)

Definition at line 40 of file pde.f90.

6.3.1.3 u_arr()

```
real(real64) function, dimension(:), allocatable pde_solver::u_arr (
    real(real64), dimension(:), intent(in) x )
```

Array version fo the U_scalar function.

Parameters

x	Array version of the stoichiometry.
---	-------------------------------------

Definition at line 211 of file pde.f90.

6.3.1.4 u_scalar()

```
real(real64) function pde_solver::u_scalar (
    real(real64), intent(in) x )
```

Function to calculate the positive electrode OCV curve, $U(c)$.

OCV stands for Open Circuit Voltage. Please refer to the paper, Chang-Hui Chen et. al. 2020 J. Electrochem Soc. 167 080534

Parameters

in	x	The stoichiometry
----	---	-------------------

Definition at line 190 of file pde.f90.

6.3.1.5 volt_array()

```
real(real64) function, dimension(:), allocatable pde_solver::volt_array (
    real(real64), dimension(:), intent(in) arrin )
```

Array voltage calculator.

Calculates array of voltages when given an array input of concentration.

Parameters

in	arrin	array input of concentrations
----	-------	-------------------------------

Definition at line 268 of file pde.f90.

6.3.1.6 volt_scalar()

```
real(real64) function pde_solver::volt_scalar (
    real(real64), intent(in) cin )
```

Scalar voltage calculator.

Calculates scalar voltage when given a scalar input of concentration

Parameters

in	cin	input concentration
----	-----	---------------------

Definition at line 242 of file pde.f90.

6.3.2 Variable Documentation

6.3.2.1 mod_dif

```
real64 mod_dif
```

The rescaled diffusion coefficient given by: $\frac{D}{R^2}$

Definition at line 25 of file pde.f90.

6.3.2.2 rhs_const

```
real64 rhs_const
```

Rescaled source at the flux boundary given by: $\left(dt + \frac{dt}{dr}\right) \frac{200Ri_{app}}{3\epsilon_{actk}FL}$.

Definition at line 25 of file pde.f90.

6.3.2.3 volt_con_ial

```
real64 volt_con_ial
```

This is a combination of parameters given by: $\frac{100i_{app}R}{3\epsilon_{actk}L}$.

Definition at line 25 of file pde.f90.

6.3.2.4 volt_con_rtf

```
real64 volt_con_rtf
```

This is a combination of parameters given by: $\frac{2R_gT}{F}$.

Definition at line 25 of file pde.f90.

File Documentation

8.1 datafitPde.f90 File Reference

Program file for solving the diffusion equation and voltage calculation, called for data fitting.

Modules

- module [datafitpde](#)

Functions/Subroutines

- real(8) function, dimension(totaltime) [crank_nicholson](#) (n, totalTime, D, R, volPer, iapp, F, L, Rg, T, K, maxCon, c0, dt)

8.1.1 Detailed Description

Program file for solving the diffusion equation and voltage calculation, called for data fitting.

This contains the subroutines necessary for evolving the state of the system under diffusion and calculating the voltage for each simulation timestep. The program contains one singular function which outputs the voltage so that it can be called in python using f2py and f90wrap for optimisation purposes.

8.2 Formula.md File Reference

8.3 input_output_netcdf.f90 File Reference

Module file for I/O using NetCDF.

Modules

- module [input_output_netcdf](#)

Functions/Subroutines

- subroutine `error_check` (ierr)
Error checking subroutine for NetCDF.
- subroutine `assign_int` (file_id, act, vect, sing, var_name, var_id_in, var_id_out)
I/O subroutine that reads integers from a NetCDF file or writes integers to a NetCDF file.
- subroutine `assign_real` (file_id, act, vect, sing, var_name, var_id_in, var_id_out)
I/O subroutine that reads reals from a NetCDF file or writes reals to a NetCDF file.
- subroutine `assign_exp_int` (var, file_id, it, var_name, var_id_in)
I/O subroutine that writes integer arrays to a variable with an infinite dimension.
- subroutine `assign_exp_real` (var, file_id, it, var_name, var_id_in)
I/O subroutine that writes real arrays to a variable with an infinite dimension.
- subroutine `create_sing_var` (var_name, var_typ, var_len, file_id, units, act, var_id_out)
I/O subroutine that creates a named variable with specific length and data type within a NetCDF file.
- subroutine `create_exp_var` (var_name, var_typ, var_len, file_id, units, act, var_id_out)
I/O subroutine that creates an expanding variable with specific dimensions and data type within a NetCDF file.
- subroutine `save_int` (var_name, file_id, vect, sing, units, act, var_len)
I/O subroutine that writes an integer vector or single number to existing variable within a NetCDF file.
- subroutine `save_real` (var_name, file_id, vect, sing, units, act, var_len)
I/O subroutine that writes a real vector or single number to existing variable within a NetCDF file.
- subroutine `fin_in_out` ()
Subroutine that closes NetCDF output and checkpoint files that are open.
- subroutine `import_input` (file_name)
I/O subroutine that opens a NetCDF file, reads values, writes them to global variables and closes the file.
- subroutine `initiate_file` (file_name)
I/O subroutine that creates a NetCDF file, initiates input variables and saves variables that are available.
- subroutine `initiate_checkp` (file_name)
I/O subroutine that creates a NetCDF file, initiates checkpoint specific variables and saves available variables.
- subroutine `load_checkp` (check_file_name, out_file_name, conc, volt_do)
I/O subroutine that reads from a checkpoint file and saves the concentration vector.
- subroutine `update_checkp` (conc, step_num)
This subroutine overwrites the concentration vector (conc) and number of time steps (step_num) in the checkpoint NetCDF file.

Variables

- integer, parameter `dp` =kind(1.0D0)
- real(kind=real64), parameter `farad` = 96485.3321233100184_DP
farad is the Faraday constant, F
- real(kind=real64), parameter `gas_con` = 8.31446261815324_DP
gas_con is the ideal gas constant, R_g
- real(kind=real64) `temp`
temp is the temperature of the simulation, T
- real(kind=real64) `rad`
rad is the radius of the particle, R
- real(kind=real64) `thick`
- real(kind=real64) `rr_coef`
rr_coef is the reaction rate coefficient, K
- real(kind=real64) `dif_coef`
dif_coef is the diffusion coefficient, D
- real(kind=real64) `iapp`

- iapp* is the applied current density as a function of time, i_{app}

 - real(kind=real64) **init_c**

init_c is the initial concentration, c_0
- real(kind=real64) **max_c**

max_c is the maximum concentration of the simulation, c_{max}
- real(kind=real64) **dt**

dt is the time step
- real(kind=real64) **vol_per**

vol_per is the active material volume fraction, ϵ_{actk}
- real(kind=real64) **final_time**

final_time is the time of the final time step
- integer(kind=int32) **sim_steps**

sim_steps is the number of simulation steps
- integer(kind=int32) **out_steps**

out_steps is the number of steps before writing to output file
- integer(kind=int32) **space_steps**

space_steps is the resolution of the radius
- integer(kind=int32) **tot_steps**

tot_steps is the total number of simulation steps
- integer(kind=int32) **output_id**

output_id is the id of the output file
- integer(kind=int32) **check_id**

check_id is the id of the checkpoint file
- integer(kind=int32) **volt_out_id**

volt_out_id is the variable id of the voltage in the output file
- integer(kind=int32) **conc_out_id**

conc_out_id is the variable id of the concentration in the output file
- integer(kind=int32) **conc_check_id**
- integer(kind=int32) **time_check_id**

time_check_id is the id of the final time of the simulation in the checkpoint file
- integer(kind=int32) **ts_check_id**

ts_check_id is the id of the final time step of the simulation in the checkpoint file
- logical **volt_do**

volt_do is the logical value which determines whether to calculate voltage to the outputfile
- logical **checkpoint**

checkpoint is the logical value which determines whether to restart simulation from the checkpoint
- integer(kind=int32) **volt_do_int**

volt_do_int is the binary representation of the *volt_do* variable
- integer(kind=int32) **checkpoint_int**

checkpoint_int is the binary representation of the *checkpoint_int*

8.3.1 Detailed Description

Module file for I/O using NetCDF.

This contains the subroutines necessary for reading and writing NetCDF files in the appropriate format.

8.4 main.f90 File Reference

Main fortran file which calls other functions from other modules.

Data Types

- interface [volt_calc](#)

Functions/Subroutines

- program [main](#)

8.4.1 Detailed Description

Main fortran file which calls other functions from other modules.

This main program calls the functions and subroutines from the [pde.f90](#) file to solve the diffusion equation, given an input netcdf file. It contains a checkpoint system as a failsafe during simulation runtime so that the entire simulation is not lost in the event of an unforeseen error.

8.4.2 Function/Subroutine Documentation

8.4.2.1 main()

```
program main
```

Definition at line 1 of file main.f90.

8.5 pde.f90 File Reference

Module file for solving the diffusion equation and voltage calculation.

Modules

- module [pde_solver](#)

Functions/Subroutines

- subroutine `setup_crank_nicholson` (A, B)
Subroutine to setup the matrices of the system of equations.
- real(real64) function, dimension(:), allocatable `crank_nicholson` (A, B, c_cur)
Crank-Nicholson function.
- real(real64) function `u_scalar` (x)
Function to calculate the positive electrode OCV curve, $U(c)$.
- real(real64) function, dimension(:), allocatable `u_arr` (x)
Array version to the `U_scalar` function.
- real(real64) function `volt_scalar` (cin)
Scalar voltage calculator.
- real(real64) function, dimension(:), allocatable `volt_array` (arrin)
Array voltage calculator.

Variables

- real(kind=real64) `rhs_const`
Rescaled source at the flux boundary given by: $\left(dt + \frac{dt}{dr}\right) \frac{200Ri_{app}}{3\epsilon_{actk}FL}$.
- real(kind=real64) `volt_con_ial`
This is a combination of parameters given by: $\frac{100i_{app}R}{3\epsilon_{actk}L}$.
- real(kind=real64) `volt_con_rtf`
This is a combination of parameters given by: $\frac{2R_gT}{F}$.
- real(kind=real64) `mod_dif`
The rescaled diffusion coefficient given by: $\frac{D}{R^2}$.

8.5.1 Detailed Description

Module file for solving the diffusion equation and voltage calculation.

This contains the subroutines necessary for evolving the state of the system under diffusion and calculating the voltage for each simulation timestep.
